

Google Ads API — Tool Documentation

D&R Flooring Control Center · internal single-advertiser reporting and campaign-management dashboard

Field	Value
Tool name	D&R Flooring Control Center
Applicant / advertiser	D&R Flooring — flooring retailer and installation company, Langley, British Columbia, Canada
Website	https://drflooring.ca
Google Cloud project ID	ytsearch-495619
Google Ads accounts accessed	One: the company's own Google Ads account (the account behind conversion tag AW-686101589), linked to a manager (MCC) account owned by the same company.
Requested access level	Basic
Distribution	None. Not published, sold, licensed or made available to any third party.
Number of users	One — the business owner.

1. Summary

The D&R Flooring Control Center is a private, internally-built web application that a single business — D&R Flooring — uses to manage its own online presence. It already consolidates Google Search Console data for drflooring.ca into one local dashboard and is in daily use for that purpose. The Google Ads API access requested here is for a further module that adds this company's own Google Ads performance to the same view, and allows a small, fixed set of management actions on this company's own campaigns.

The tool is used by one person, runs on one computer, and touches exactly one Google Ads account: the applicant's own. It is not a product, is not distributed, is not offered to clients, and manages no third party's advertising.

2. The problem it solves

D&R Flooring sells flooring both in-store and through its website. Most of the catalogue does not display a price online; the intended customer action is a phone call, which is tracked as a conversion event. That means the business's actual results are spread across three systems that never meet:

- **Google Search Console** — what the site is shown for organically, and from what position.
- **Google Analytics 4** — sessions, and the phone-call conversion events (`call_click`, `call_for_price_click`).
- **Google Ads** — paid spend, clicks and conversions.

The question the owner cannot answer today is the obvious one: for a given product category, is the business better served by paid spend or by the organic ranking it already has? Answering it requires paid and organic numbers side by side against the same conversion event, over the same dates. No single Google interface provides that, which is the reason this tool exists.

3. Current status of the tool

Stated plainly, because the two halves are at different stages:

Component	Status
Application framework — local web server, database, scheduled sync jobs, job/audit logging, settings	Built and running.
Google Search Console module — daily site and per-URL performance sync, trend and comparison reporting	Built and running. Currently holds roughly 180 days of daily history for drflooring.ca.
Google Ads module — reporting sync and the management actions described in sections 5 and 6	Designed, not yet implemented. It cannot be implemented before a developer token exists, which is the reason for this application.
Google Analytics 4 module — sessions and call-conversion events	Planned, alongside the Google Ads module.

No Google Ads API call has been made by this tool. It has never held a developer token.

4. How the tool is built and deployed

- **Deployment:** a Python application run from the command line on one Windows computer at the business. It binds to the loopback interface (127.0.0.1) only and refuses to bind any other address. It is not hosted, not exposed to the internet, and not reachable from outside that machine.
- **Users:** one — the business owner, who is also the owner of the Google Ads account. There is no sign-up, no multi-tenancy and no user accounts, because there is only ever one user.
- **Storage:** a local SQLite database file on the same machine. Nothing is uploaded to any third-party service.
- **Design rule:** all external API calls happen in scheduled background sync jobs; the interface reads only the local database. Every API response is stored once with a timestamp and read from storage thereafter, so opening a page never issues an API call. This keeps API usage low, predictable and independent of how often the owner looks at the dashboard.
- **Credentials:** the developer token, OAuth client ID/secret and refresh token are stored in a local environment file that is excluded from version control. They are never transmitted anywhere other than to Google's own endpoints, and are never displayed in the interface.

5. Google Ads API usage — reporting (read)

One scheduled job per day retrieves campaign, ad-group and keyword performance via `GoogleAdsService.SearchStream` and writes it to the local database. Reporting is the primary purpose of the integration.

Representative query:

```
SELECT
  campaign.id, campaign.name, campaign.status,
  campaign.advertising_channel_type,
  metrics.impressions, metrics.clicks, metrics.cost_micros,
  metrics.conversions, metrics.all_conversions,
  segments.date
FROM campaign
WHERE segments.date DURING LAST_30_DAYS
```

The retrieved metrics are shown next to the organic Search Console numbers and the phone-call conversion events for the same dates — the combined view described in section 2.

6. Google Ads API usage — management (write)

The tool performs a deliberately small, fixed set of write operations on the applicant's own campaigns. There is no bulk automation, no automated bidding logic, and no operation that runs without a person initiating it.

Operation	API service	Trigger
Pause or enable a campaign	CampaignService.MutateCampaigns	Owner clicks, then confirms in a dialog
Pause or enable an ad group	AdGroupService.MutateAdGroups	Owner clicks, then confirms in a dialog

Change a campaign's daily budget	CampaignBudgetService.MutateCampaignBudgets	Owner enters an amount, then confirms
Add a negative keyword	CampaignCriterionService / AdGroupCriterionService	Owner enters the term, then confirms

Controls applied to every write:

- **Explicit confirmation.** Every mutate is preceded by a dialog stating the account, the entity and the exact before/after value. Nothing is written on a single click.
- **Audit log.** Every attempted mutate — the operation, the resource name, the previous value, the new value, the timestamp and the API response — is written to a local audit table that cannot be edited from the interface.
- **No scheduled writes.** Scheduled jobs read only. A write only ever happens because a person performed an action in the interface.
- **No creation or deletion.** The tool does not create or remove campaigns, ad groups or ads. It adjusts the state, budget and negative keywords of campaigns created in the Google Ads interface.

7. Campaign types supported

The tool supports the campaign types this advertiser runs. Reporting covers all of them; the management actions in section 6 apply to each at campaign level.

Campaign type	Use by this advertiser
Search	Text ads for flooring product and service terms in the local service area.
Performance Max	Goal-based campaigns across Google's surfaces, optimising for the phone-call conversion.
Display	Image ads for awareness and remarketing to prior site visitors.
Call-only	Ads whose action is a direct phone call — the store's primary conversion, since most products are priced on enquiry.

Not supported and not requested: App, Shopping, Demand Gen, Local Services, Hotel, and Smart campaigns. The advertiser does not run them.

8. Expected API volume

One advertiser, one account, one daily reporting job, and occasional human-initiated changes. Expected usage is a very small fraction of the Basic access limit of 15,000 operations per day.

Activity	Frequency	Approximate operations/day
Campaign / ad-group / keyword report sync	Once daily, scheduled	3–10
Management actions (pause, budget, negatives)	Only when the owner acts; typically none	0–10
Expected daily total		well under 50

9. Interface

A local web interface of a few pages. The pages marked *built* are running today; the Google Ads pages are the ones this application would let the applicant build.

Page	Contents	Status
Overview	Site-wide organic clicks, impressions, click-through rate and average position, with period-over-period comparison, daily trend charts and a ranked table of best-performing pages.	Built
Jobs	Every scheduled sync: when it last ran, whether it succeeded, how many rows it wrote, any error, and a manual run control. Full run history.	Built
Settings	Sync windows and schedules; a status table showing which integrations are configured.	Built
Ads performance	Campaign table with spend, clicks, conversions and cost per phone call, shown beside the organic figures for the same dates.	Planned

Ads
management

The section 6 actions, each behind a confirmation dialog, with the audit log of every previous change.

Planned

10. Data handling and compliance

- Google Ads data retrieved by this tool is stored only in the local database on the business's own computer, and is used only by the business owner to manage the business's own advertising.
- No Google Ads data is shared with, sold to, or transmitted to any third party. There is no external server, analytics service or telemetry of any kind.
- The tool collects no end-user personal information. It retrieves aggregate campaign performance metrics only.
- The tool is not offered to any other advertiser and has no capability to operate on an account outside the applicant's own manager account.
- The applicant has read and agrees to comply with the Google Ads API Terms and Conditions and the Required Minimum Functionality policy, and understands the access level's operation limits.

Prepared for the Google Ads API developer token (Basic access) application. Contact for this application: the API contact email set in the manager account's API Center.
